HVAC Duct Aspect Ratio Sensitivity Study

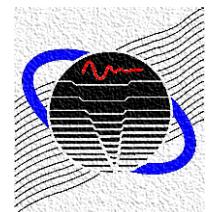

Caoyang Li
University of Kentucky

Vibro-Acoustics Consortium

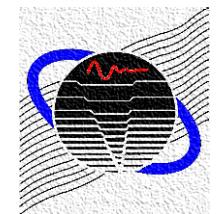

Overview

- Simulation Approach in Siemens Simcenter
- Aspect Ratio Sensitivity Study
- Improving the Attenuation with Large Aspect Ratios

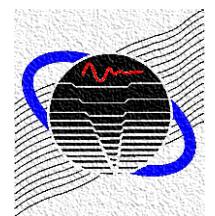

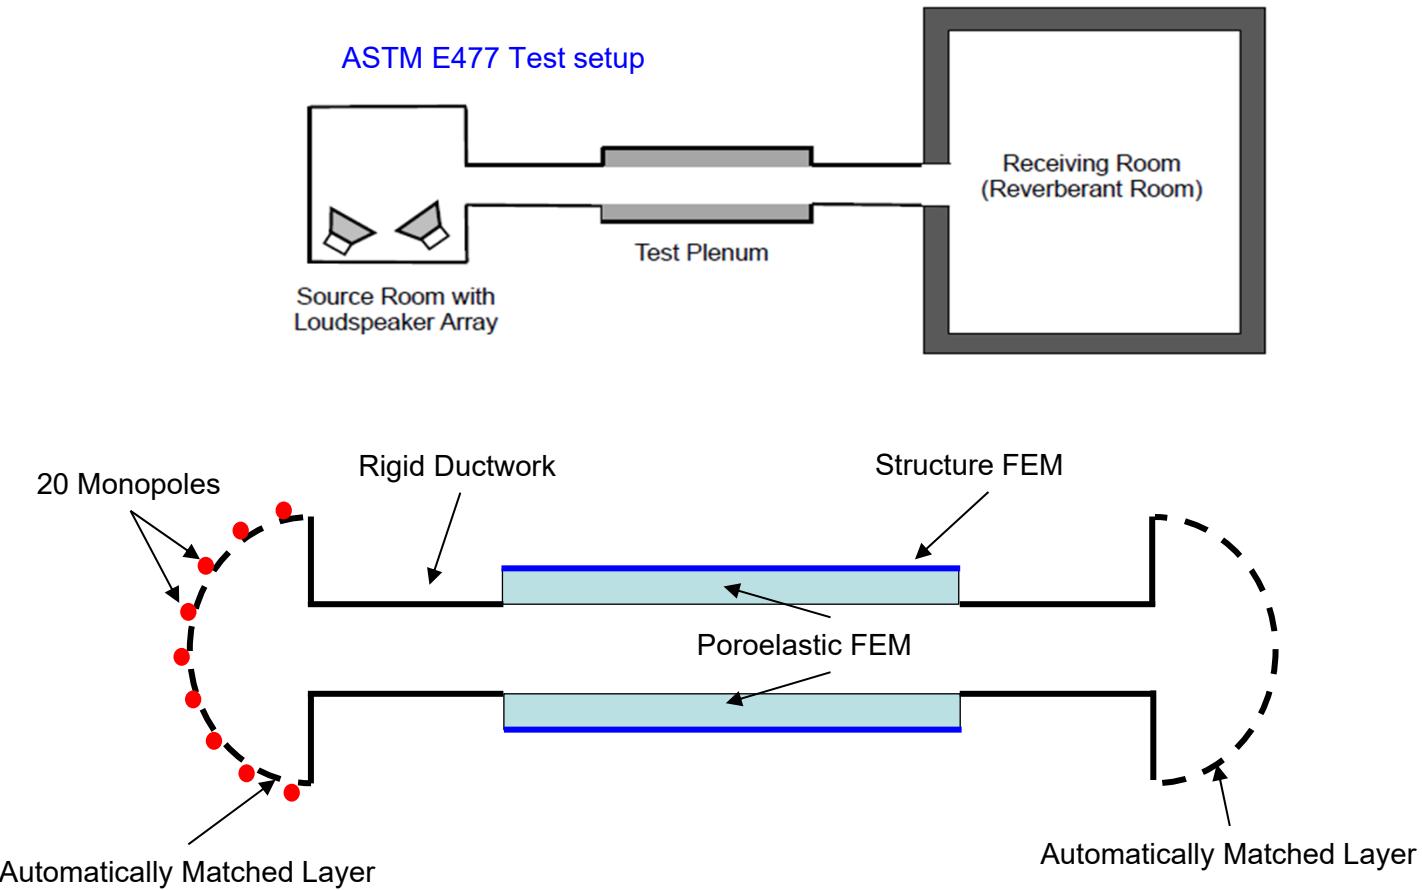

Insertion Loss

$$IL = L_{W,unlined} - L_{W,lined}$$

Test Setup

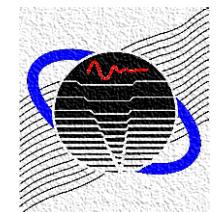

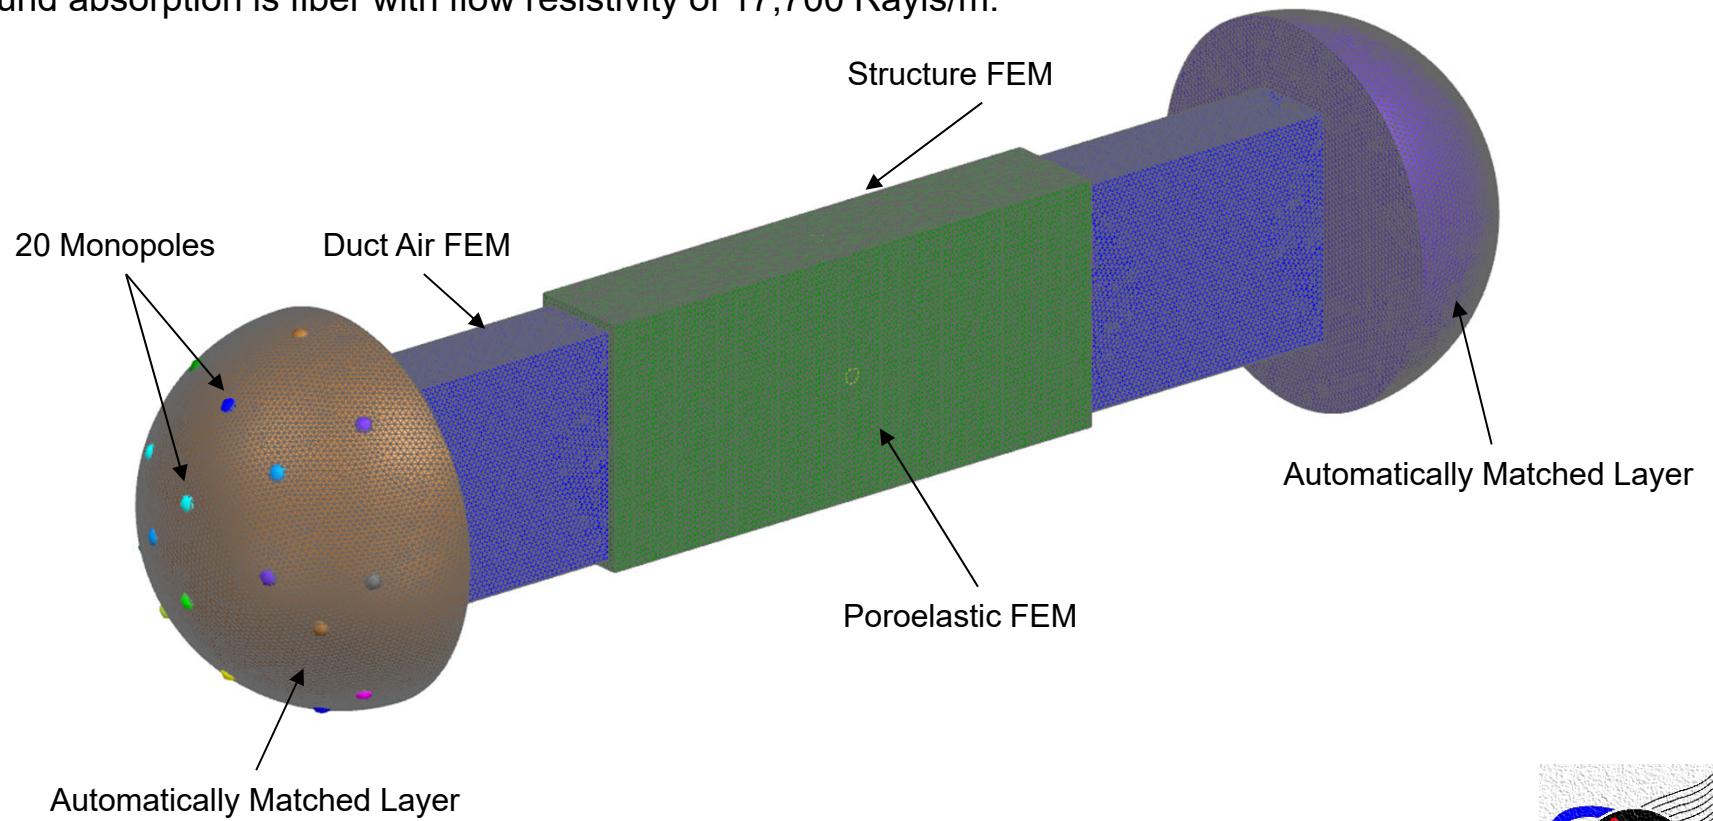

Siemens Simcenter FEM Model

10 ft test section (total length 20 ft).

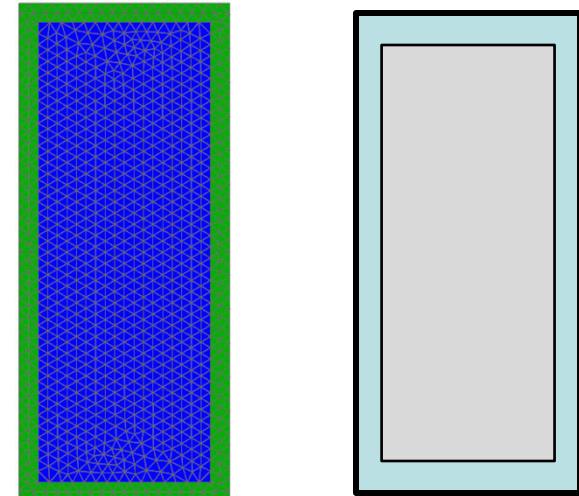

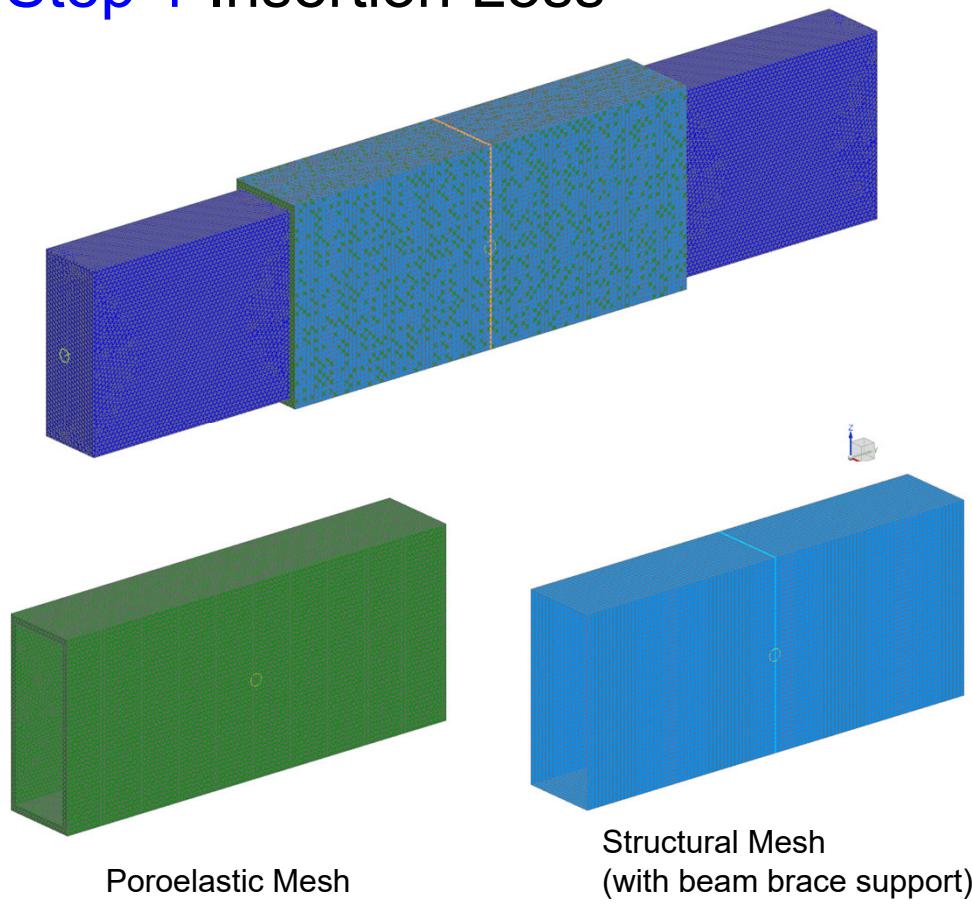

Duct wall thickness is 0.034 in (21 gage).

Sound absorption is fiber with flow resistivity of 17,700 Rayls/m.

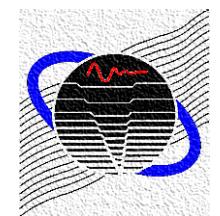

Siemens Simcenter FEM Model

Step 1 Insertion Loss

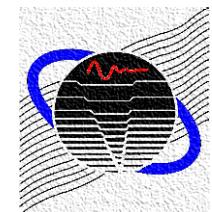

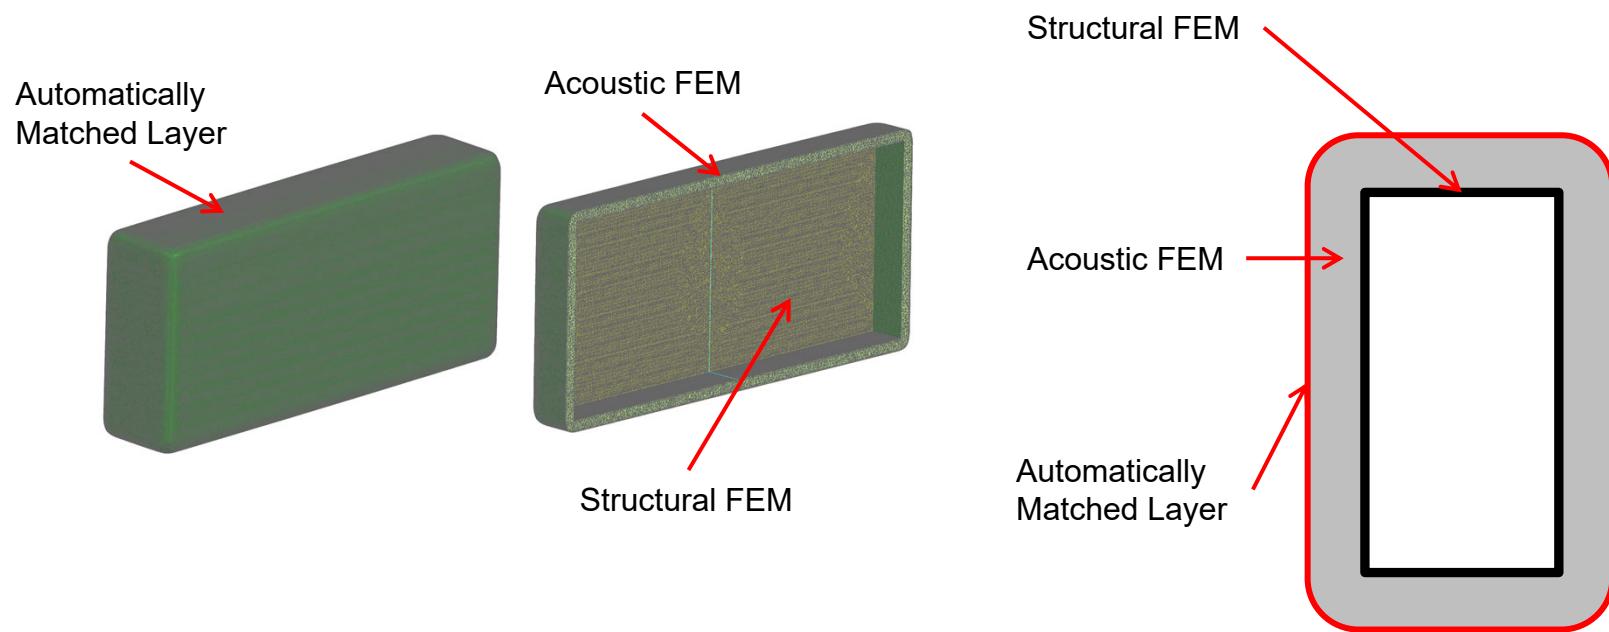

Cross-section view of mesh (left) and schematic (right).

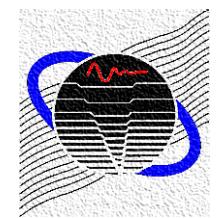

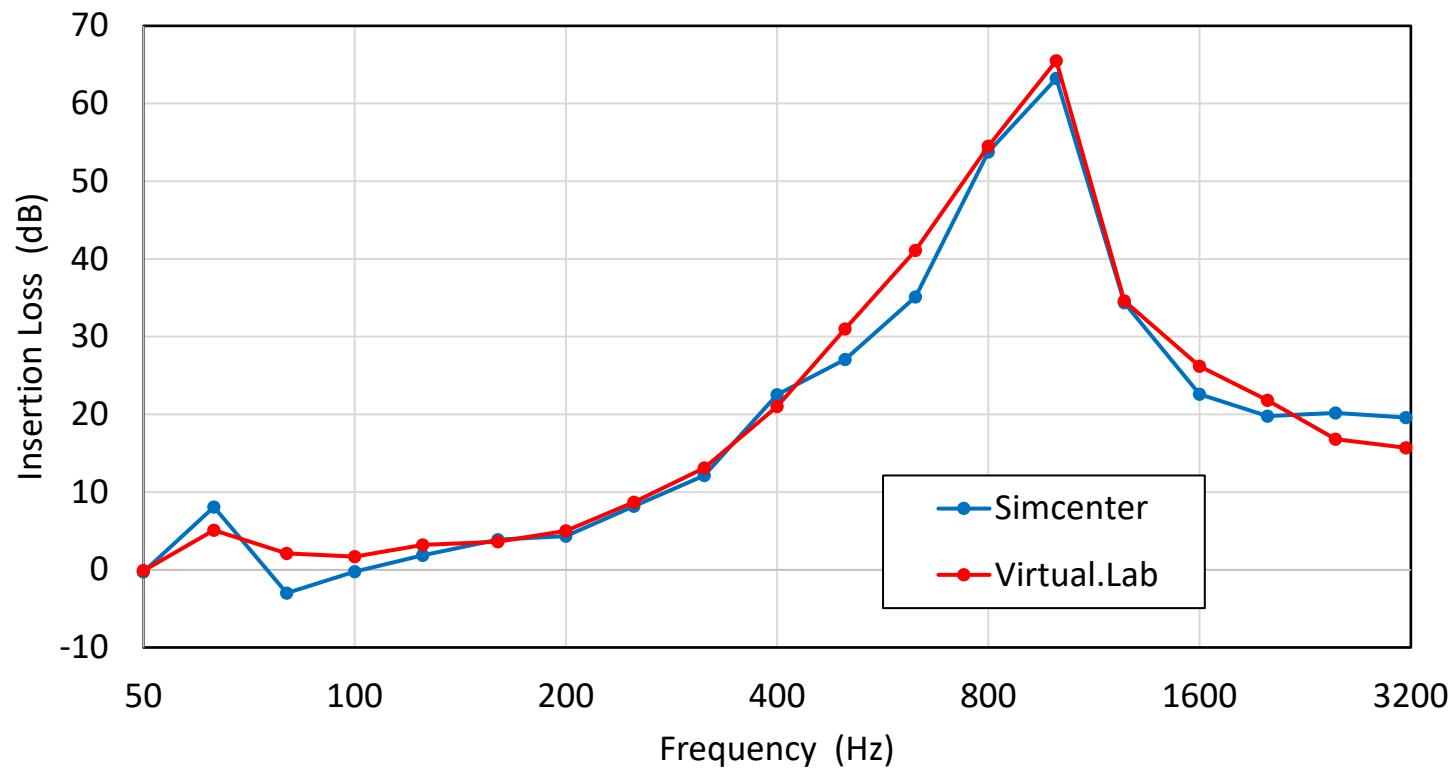

Siemens Simcenter FEM Model

Step 2 Breakout Transmission Loss

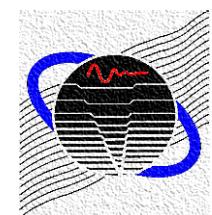

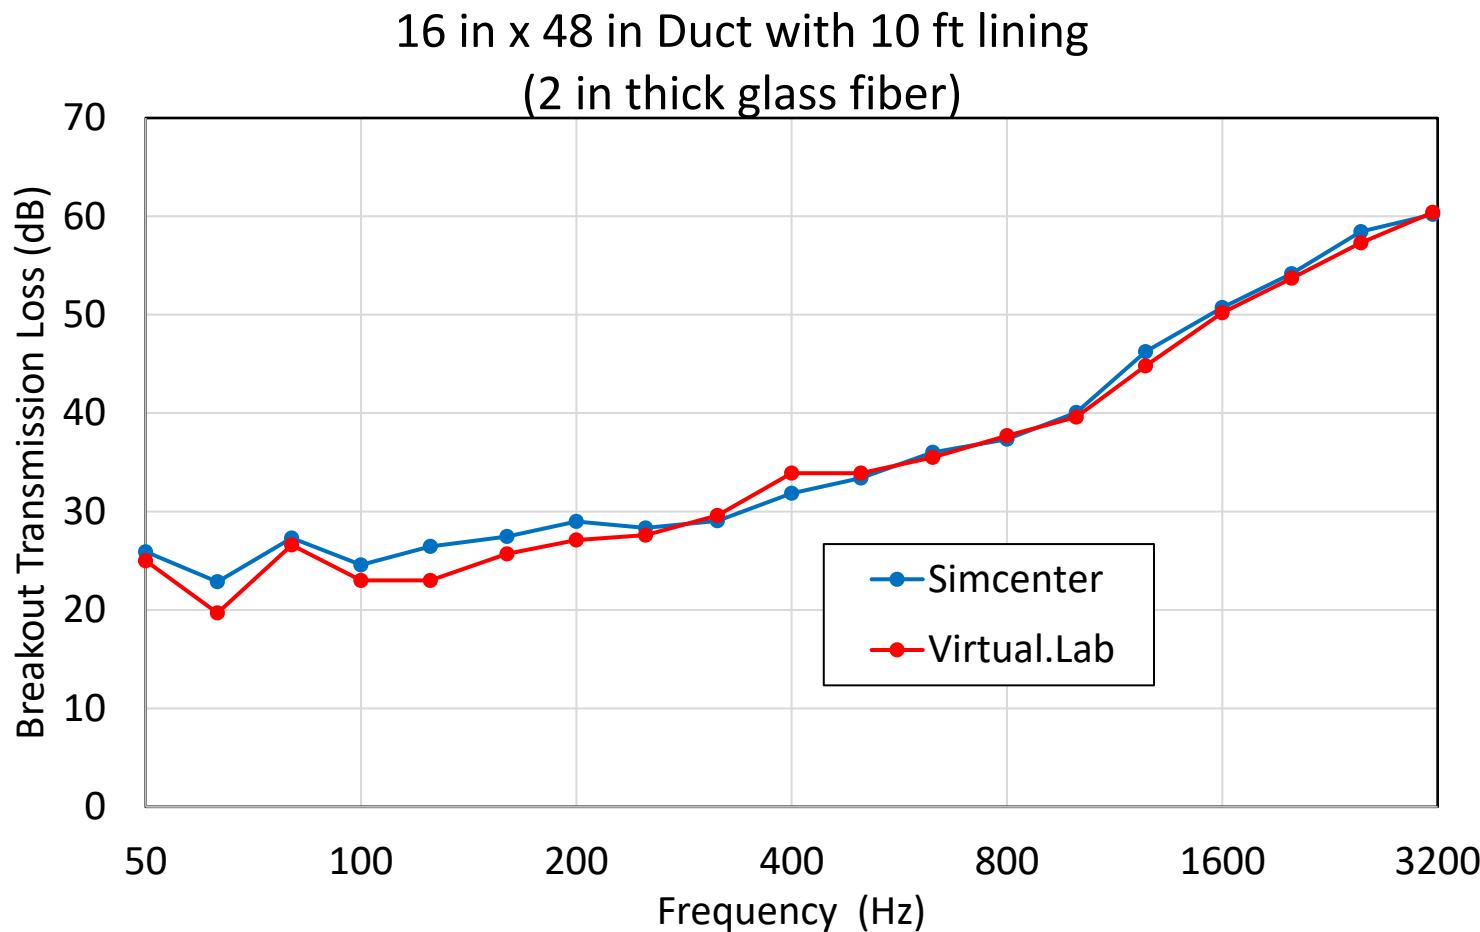

Insertion Loss

16 in x 48 in Duct of 20 ft long with 10 ft lining
(2 in glass fiber at all sides)

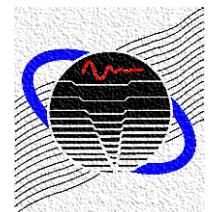

Breakout Transmission Loss

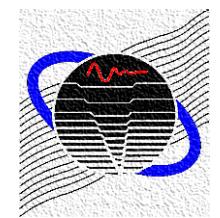

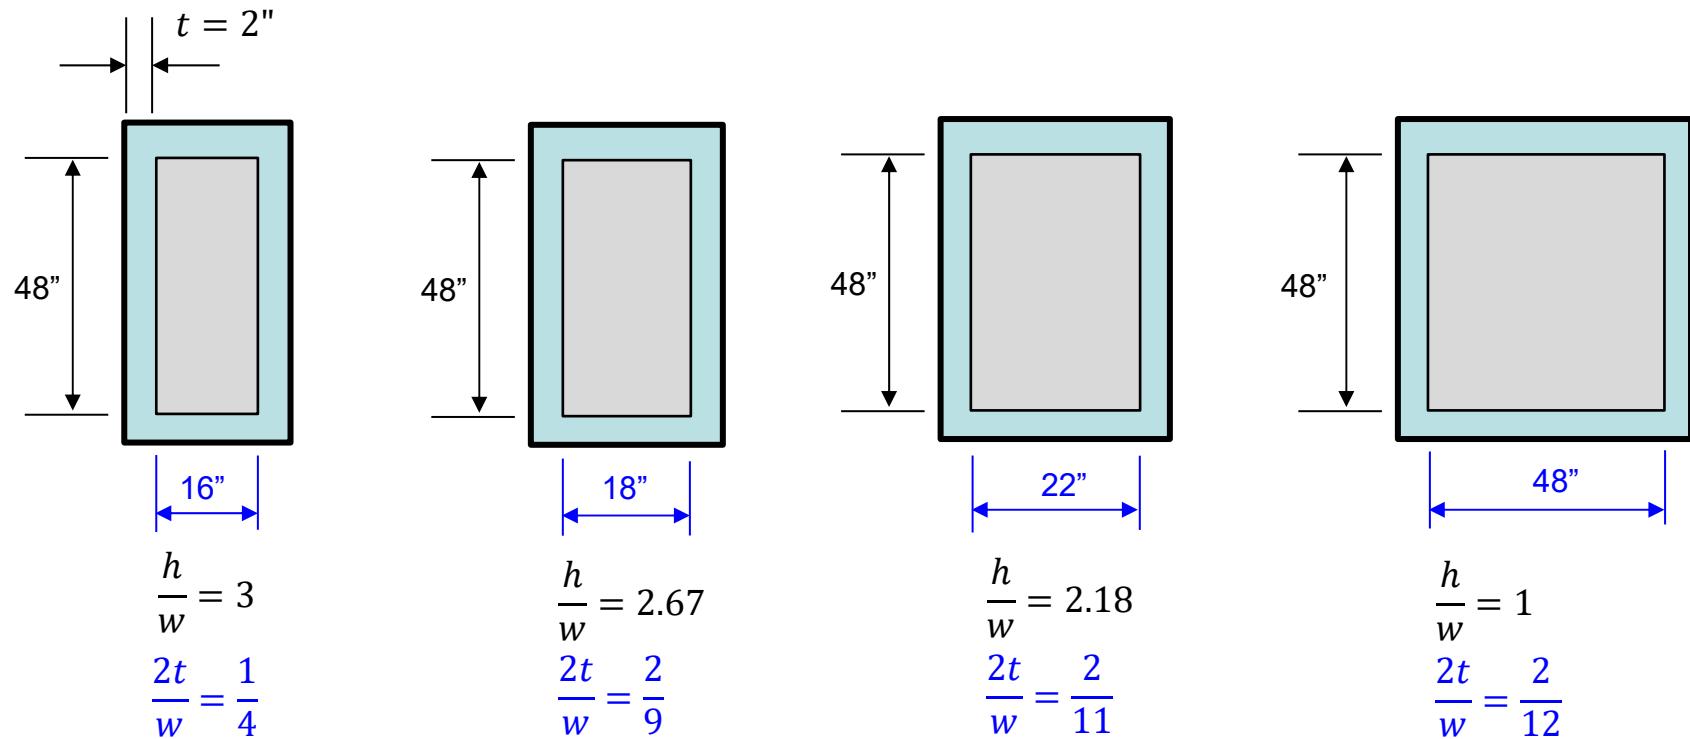

Overview

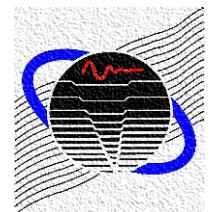

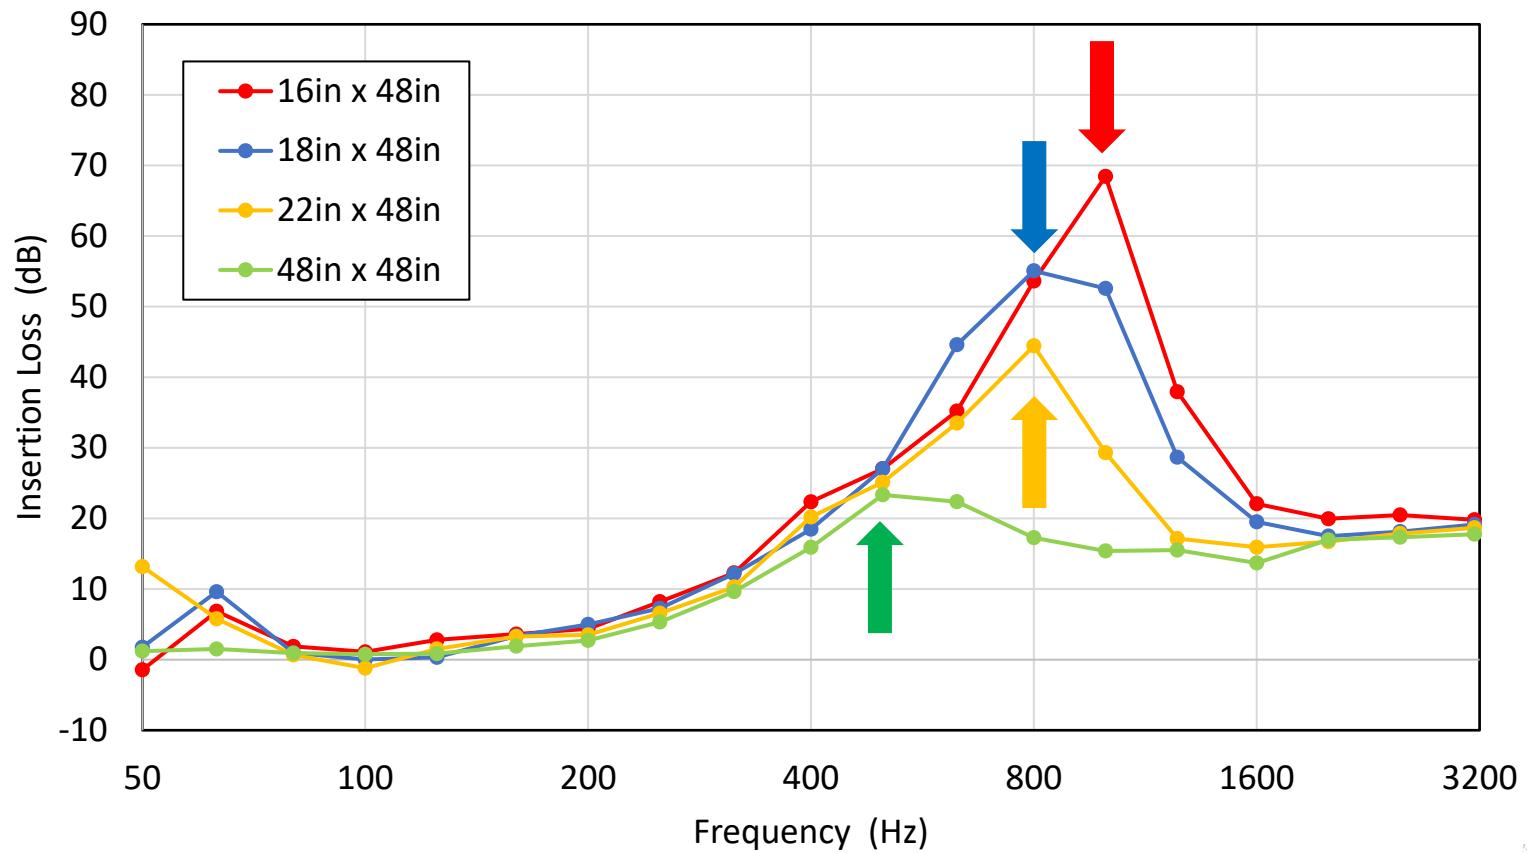

- Simulation Approach in Siemens Simcenter
- Aspect Ratio Sensitivity Study
- Improving the Attenuation with Large Aspect Ratios

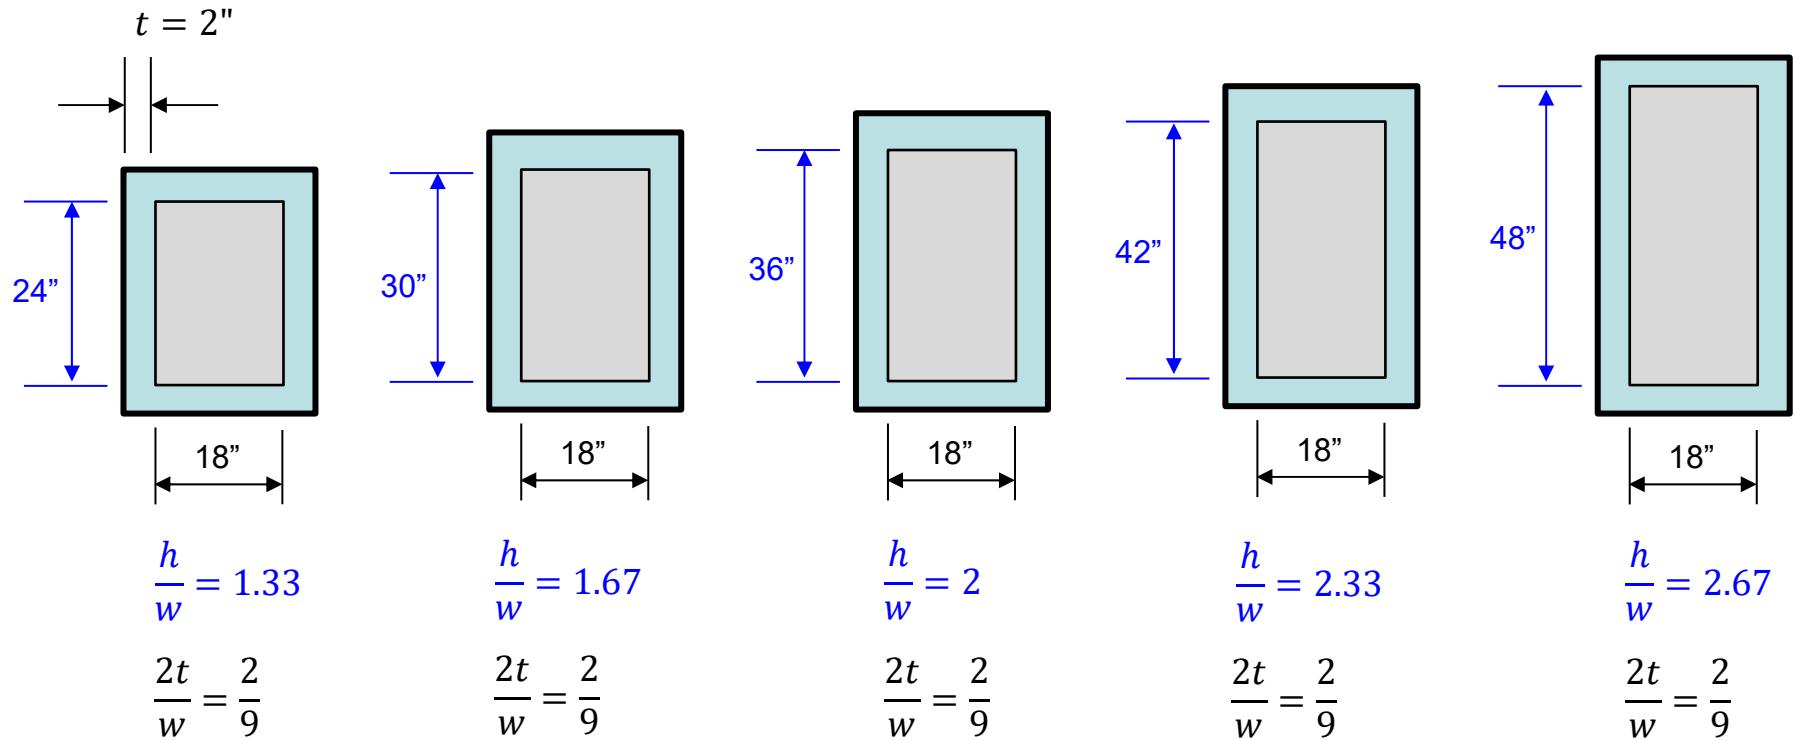

Sensitivity Study Constant Height

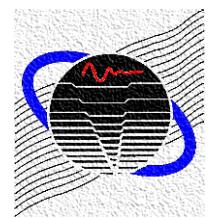

Insertion Loss Constant Height

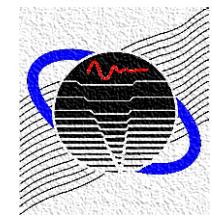

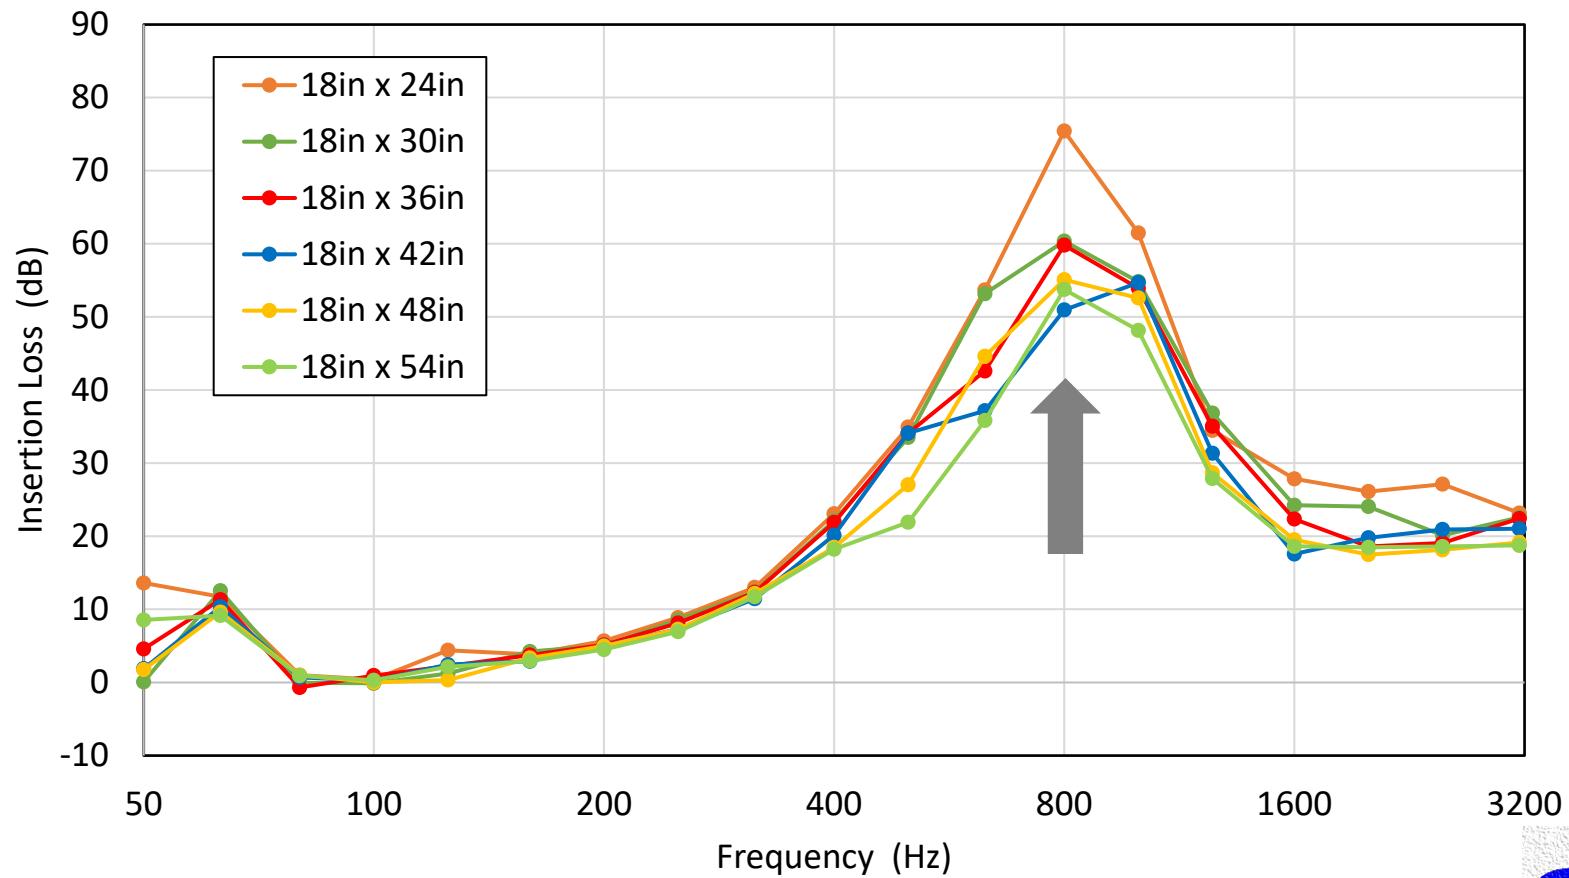

Sensitivity Study Constant Width

Note: 2 inch fiber on sides.

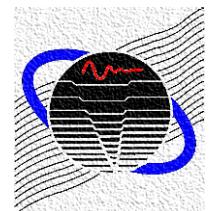

Insertion Loss Constant Width

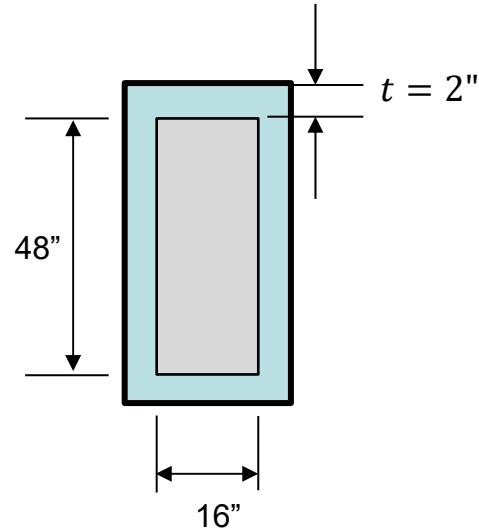

Overview

- Simulation Approach in Siemens Simcenter
- Aspect Ratio Sensitivity Study
- Improving the Attenuation with Large Aspect Ratios

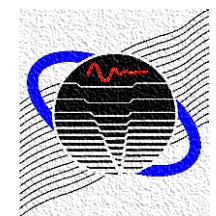

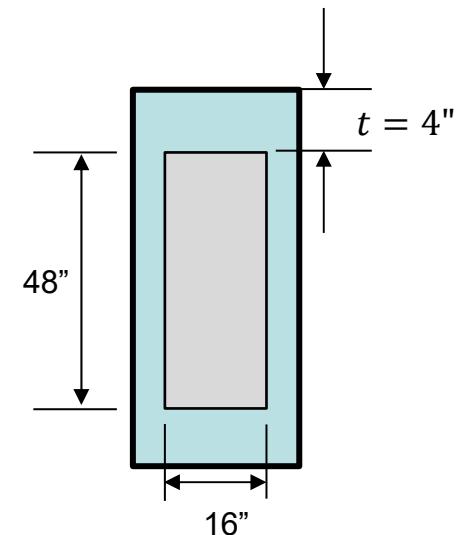

Improvements Increase Absorption

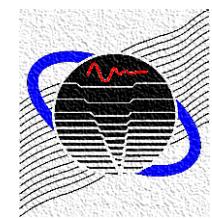

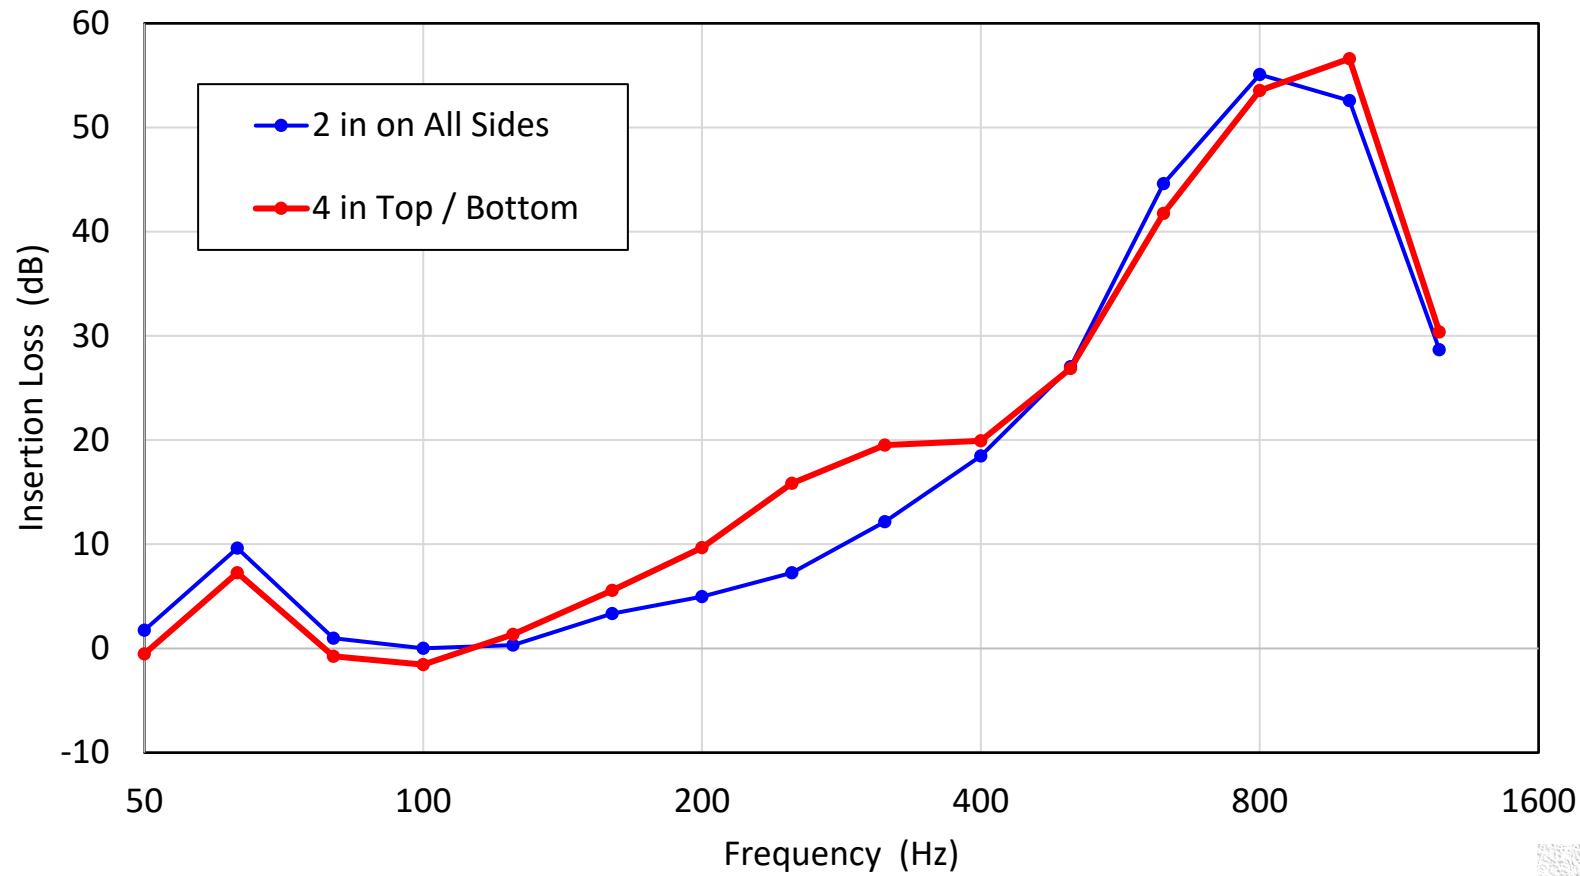

2 in lining on all sides

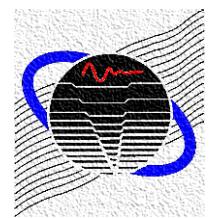

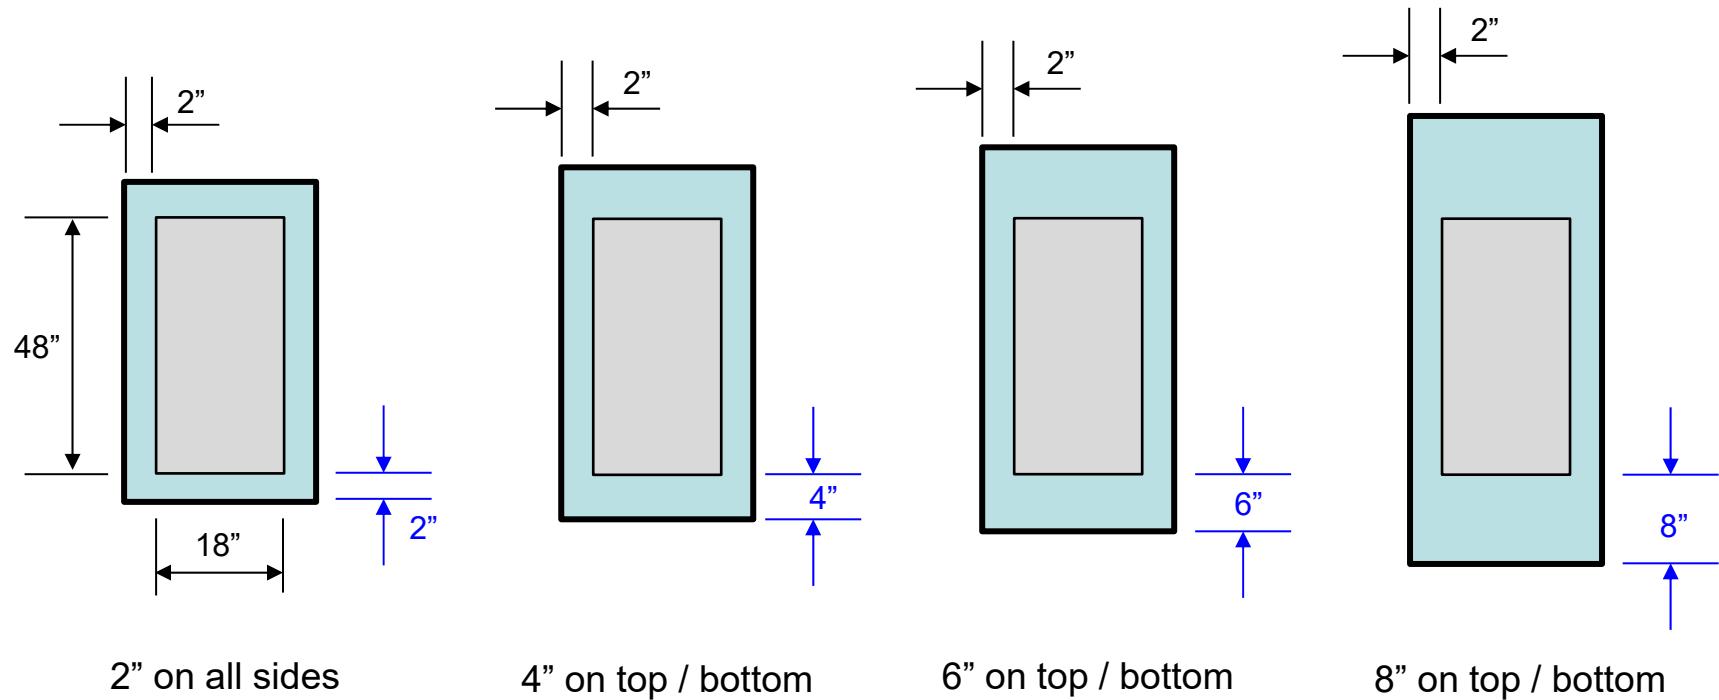

4 in lining on top / bottom

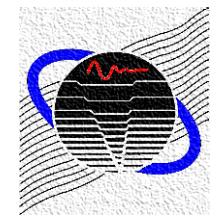

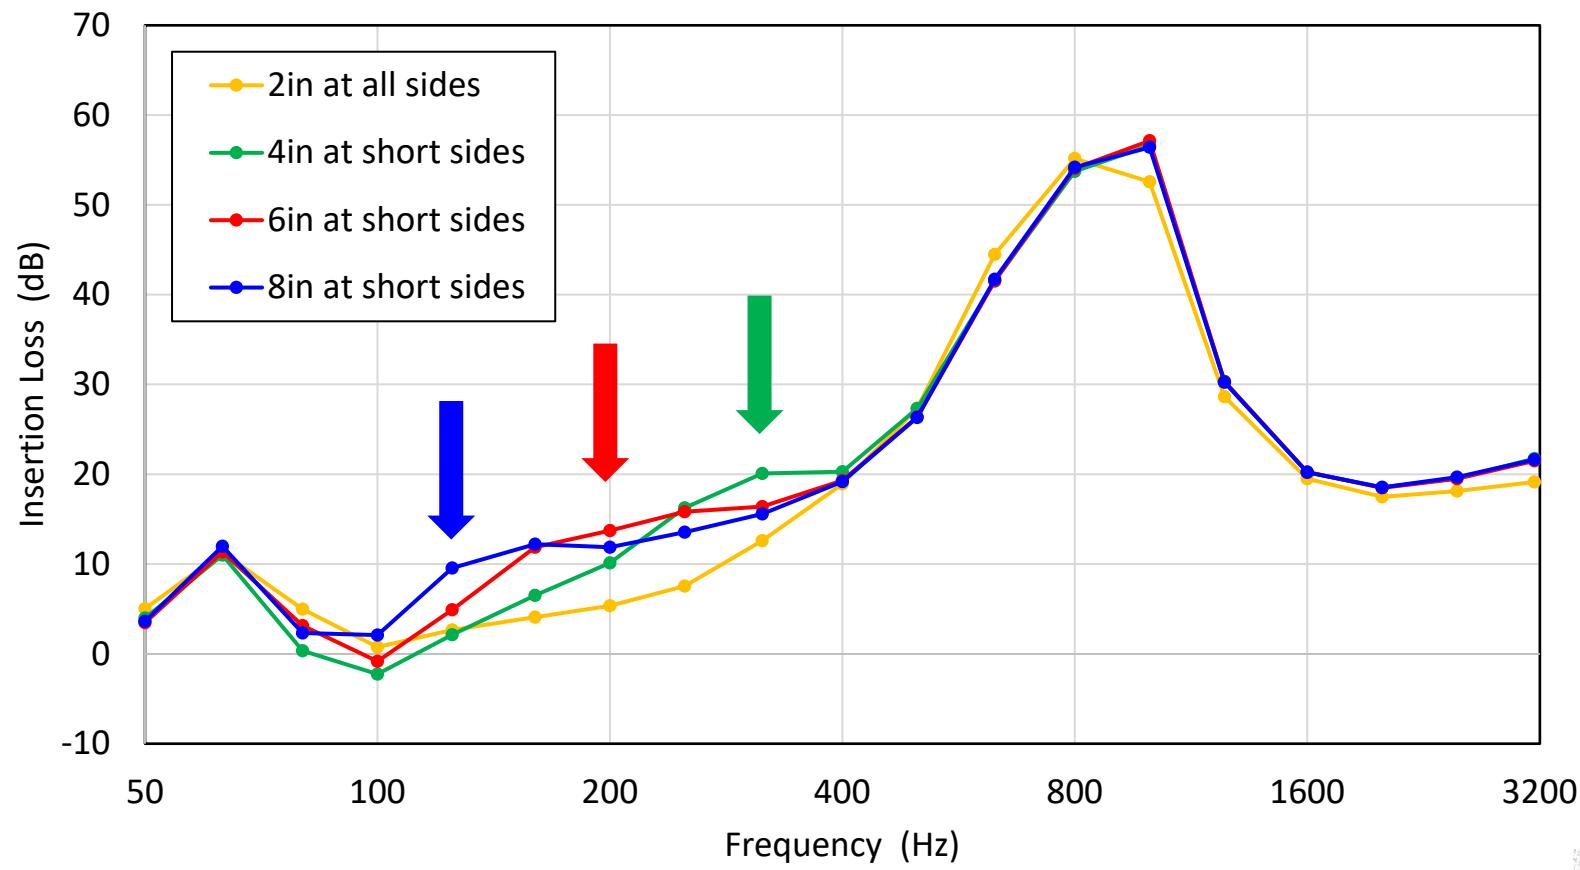

Insertion Loss Thicker Absorption

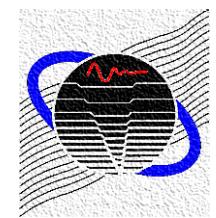

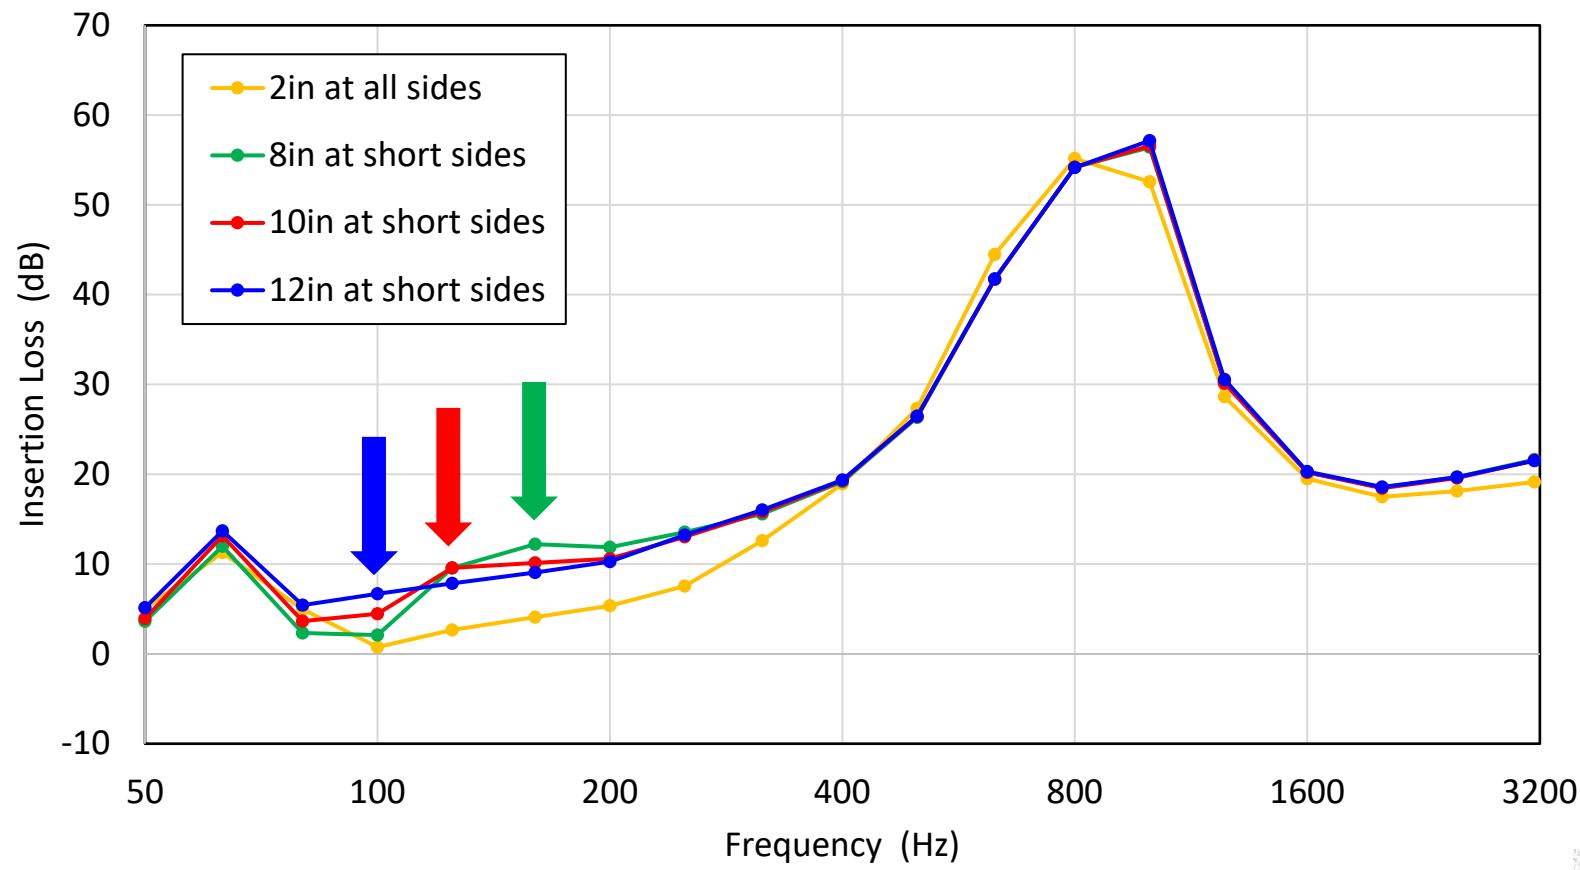

Improvements Increase Absorption

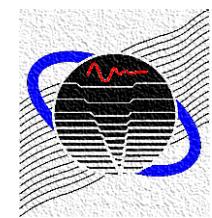

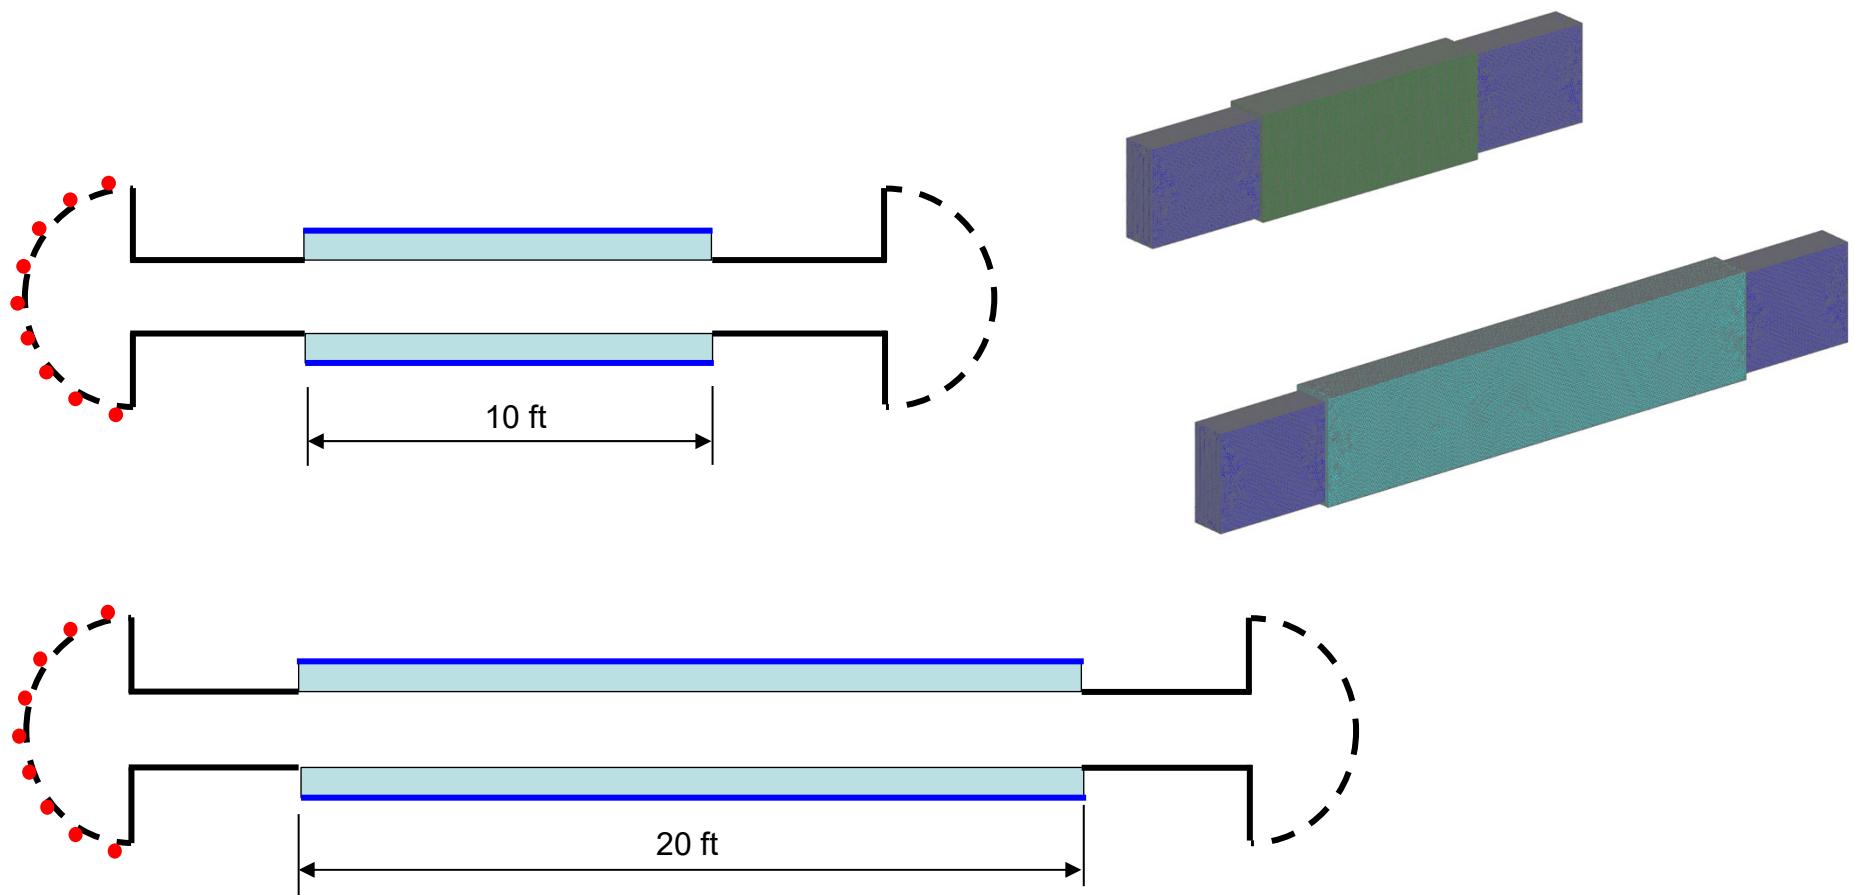

Insertion Loss Thicker Absorption

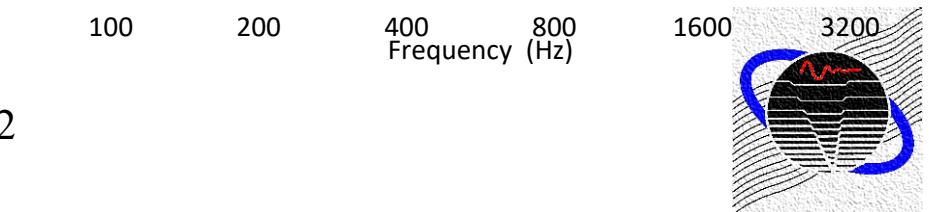

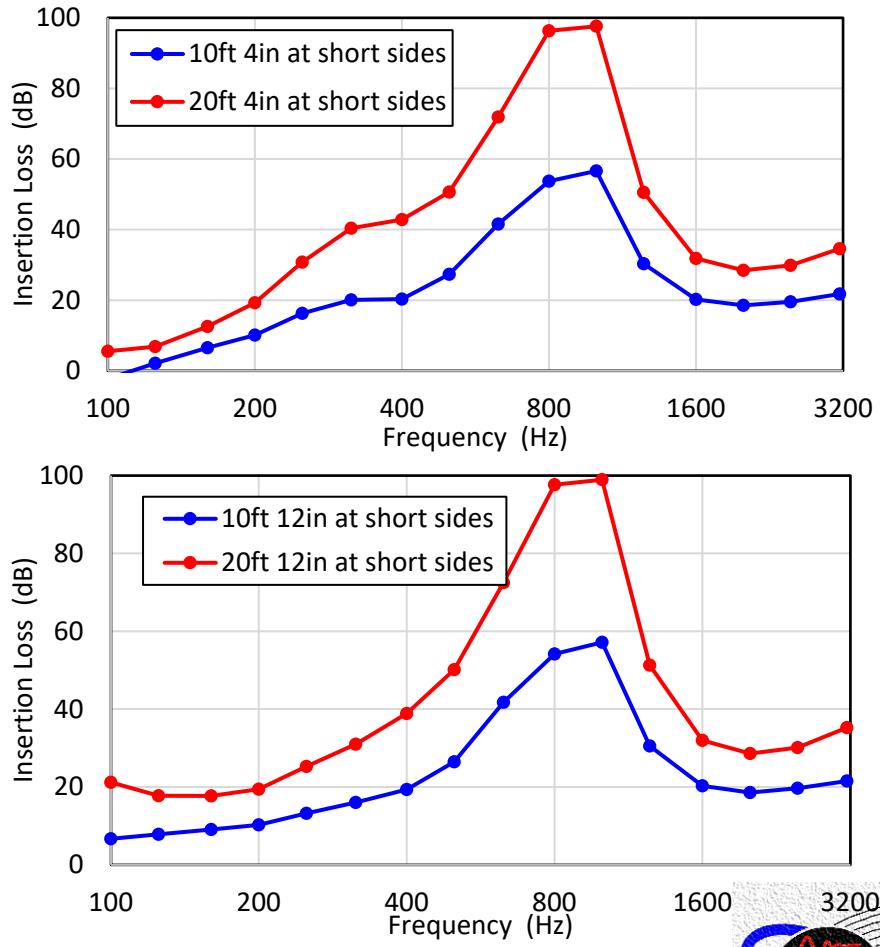

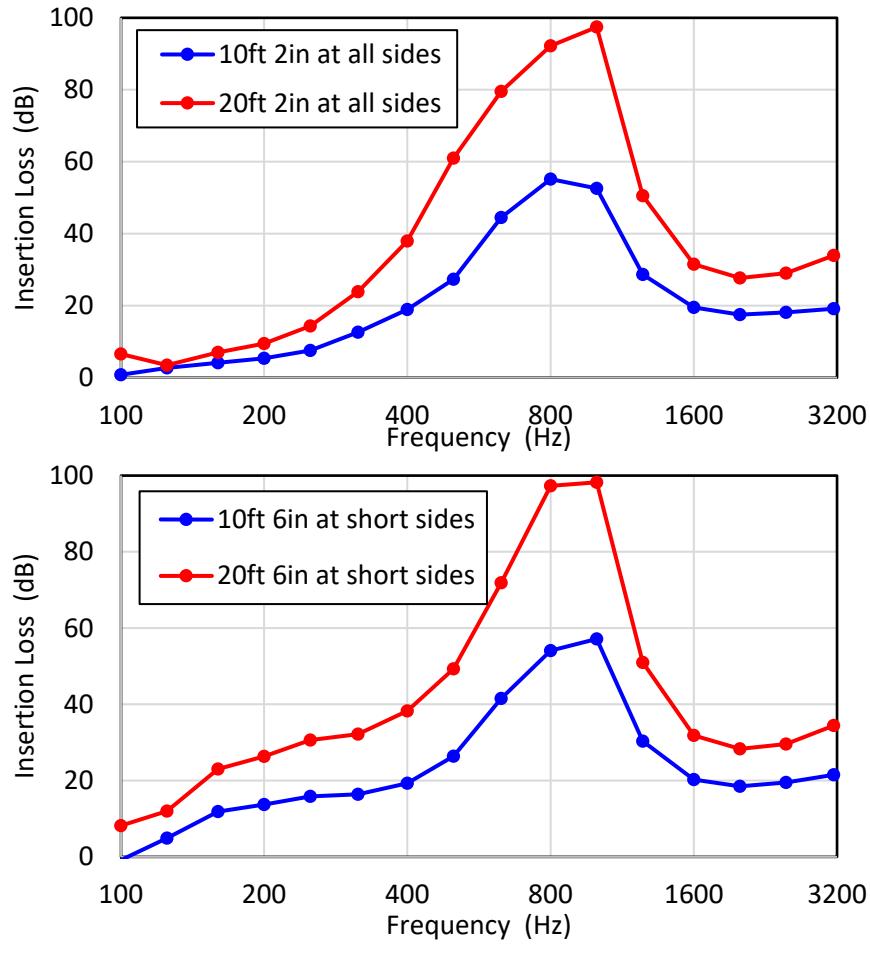

Insertion Loss Thicker Absorption

Improvements Add Length

Insertion Loss Add Length

Summary

- FEM Simcenter was used successfully to predict the insertion loss and breakout transmission loss.
- The smallest cross-sectional dimension drives the insertion loss performance.
- Performance can be improved by increasing the sound absorption thickness at the top / bottom of the duct assuming the height is the longest dimension.
